

## **ABSTRACT OF THE INVENTION**

A board game assembly and its associated method of play. The board game assembly contains a game board that is divided into different areas. Playing spaces are on the game board and extend throughout the various areas. Each player is provided with a set of chess pieces. Each player uses the chess game pieces in a first level of play in an attempt to gain control of the various areas on the game board. Once one player obtains control of a majority of the areas on the game board, that player can declare chess. Once chess is declared, a second level of play begins and the rules of the game change. Utilizing the remaining chess pieces that are on the board, the remaining players play traditional chess.
